SM Series Videographic Recorders

A clearer view of your process

- High visibility process displays
- Easy remote access and operation via Ethernet communications
- High specification 21 CFR Part 11 compliant process data security
- Automated process data management
- Heightened reliability through solid state memory card options
- Hose down protection to NEMA 4 & IP66 Standards

ABB

SM Series
Videographic Recorders

Raising the standards of
data storage

The SM Series of Videographic Recorders provide solutions for electronic data recording and analysis. Features include a fully solid state design, clear operator displays and an intuitive user interface. Ethernet communications allow wide access to process information and historical data while high specification security features ensure the security of data at all times.

SM1000
Videographic Recorder

The SM1000 features the state of the art technology inherent across the SM Series, yet is very simple to use. Solid-state Compact Flash and SmartMedia memory card options provide storage capability far greater than typically found on a recorder of this price level.
The SM1000's ability to record up to 12 process signals also means that it can do the work of two similarly priced recorders.

SM2000
Advanced Videographic Recorder

The SM2000 Advanced Videographic Recorder provides advanced functionality recording and high specification hardware features, making it suitable for almost any recording application.

The Windows™ style operator interface is simplified further by the SM2000's touch sensitive display, effortlessly guiding the operator through the configuration and enabling the rapid entry of text information using an on-screen keyboard. The high clarity of the TFT display ensures maximum visibility of process information.

A high capacity 8Mb internal memory allows the operator to review large amounts of process data history on-screen. Optional math and logic capabilities and advanced configuration mode enable the SM2000 to take on demanding applications with ease.

robust and convenient archive storage

SM3000
Multi-point Videographic Recorder

Multipoint process monitoring is made simple by the SM3000. Up to 36 channels can be recorded - each channel features 4 process alarms and 2 flow totalizers. 6 process groups are provided, allowing channels to be grouped together and individual displays created for different processes.

The large 31cm (12.1in), bright and clear display maximizes visibility of process data. It allows the use of a wide variety of displays, including a circular chart format and an overview of all 6 process groups.

Secure, Precise, Reliable Recording

Intuitive User Interface

All operation of the SM Series is done via Windows
style menus and dialogs that effortlessly guide
the operator through the functions they require.
A channel-by-channel approach to the configuration
layout ensures simple and fast setup.

Thriving in Real Process Conditions

Uniquely for a product of this type, the SM Series
has a protection rating of NEMA 4X & IP66.
This enables it to be installed, without additional
protection, in applications that require frequent
hose-down.

## Industrial Standard, High Capacity, Robust Archive Storage

Either Compact Flash or SmartMedia memory card options are available for storage of process data. The solid-state nature of
these devices provides maximum reliability, while their large storage capacity ensures minimum operator intervention to retrieve
process data.

The graph below shows the time that a memory card will last when recording 6 channels at a sample rate of 10 seconds.

A Clear View of Your Process

Multiple display formats, including strip and circular charts, bargraph, digital indictor and process displays, provide a clear view of process information.

Guaranteed Data Security

The recorder's internal flash memory used to store process data and configuration details is not reliant on battery backup to retain data during power failures.

Multiple users can be configured, each with individual user name, password and access rights. A comprehensive audit log records configuration changes, calibration changes, system events and many other items key to data security. Where applicable, all entries are detailed with operator identification.

A media door lock is provided as standard to ensure the security of the memory card.

The SM Series' standard compliment of compressive security features ensure that it is fully compliant to the requirements of 21 CFR Part 11.

Ethernet Communications

It is very simple to connect an SM Series Recorder into existing plant networks via Ethernet communications. Once connected, remote process monitoring, access to archived data and email facilities become instantly available. Via the use of modem router or GSM technologies the SM Series' labour saving Ethernet features can still be used when a recorder is in a remote location.

Remote Process Monitoring

Remote access to an SM Series is possible via the use of any standard web browser. Detailed real-time information is available for current alarm and totalizer conditions, memory card status and many other key process details.

For an on-line demonstration of this feature enter, http://217.33.207.105 in the address bar of your web browser.
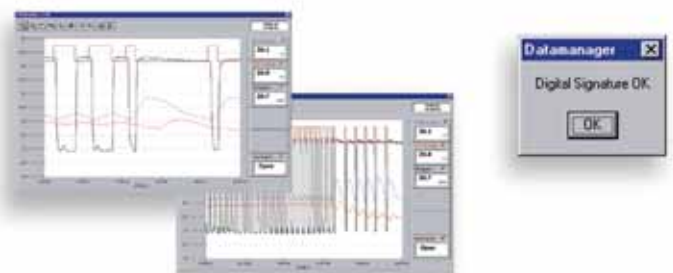

Email Notification

Any Ethernet equipped SM Series Recorder is capable of sending email notification of important events. Emails can be triggered from process alarms or other key events and can be sent to multiple recipients. Detailed process reports can also be emailed at scheduled times.

Automatic Data File Collection

All process data files created by an SM Series Recorder can be remotely accessed via its Ethernet connection. Using ABB's File Transfer Scheduler software it is possible to automatically collect data files from any number of records.

DataManager

Analysis of process data archived by an SM Series Recorder can easily be performed using DataManager advanced analysis software. In addition to charting process data and the validation of file security, DataManager provides database management of all data files and historical logs archived by any number of recorders. This enables secure long-term storage and simple retrieval of process data.
